<p>8) <i>Wikipedia, 2006</i> <i>(through the suggestion of Archt. Francisco Padua, Jr., UAP Camarines Chapter)</i></p>	<p>An architect is a person who is involved in the <u>planning, designing</u> and oversight of a <u>building's construction</u>. The word "architect" (Latin: <i>architectus</i>) derives from the Greek <i>arkhitekton</i> (<i>arkhi</i> (chief) + <i>tektion</i> (builder)"). In the broadest sense an architect is a person who translates the user's needs into the builder's requirements. An architect must thoroughly understand the <u>building and operational codes</u> under which his or her design must conform. That degree of knowledge is necessary so that he or she is not apt to omit any necessary requirements, or produce improper, conflicting, ambiguous, or confusing requirements. Architects <i>must</i> understand the various methods available to the builder for building the client's structure, so that he or she can negotiate with the client to produce a best possible compromise of the results desired within explicit cost and time boundaries.</p> <p>Architects must frequently make building design and planning decisions that affect the safety and well being of the general public. Architects are required to obtain specialized education and documented work experience to obtain licensure to practice architecture, similar to the requirements for other <u>professionals</u>, with requirements for practice varying from place</p>	<p>Architecture (from Latin, <i>architectura</i> and ultimately from Greek, <i>αρχιτεκτων</i>, "a master builder", from <i>αρχι</i>- "chief, leader" and <i>τεκτων</i>, "builder, carpenter") is the <u>art and science of designing buildings and structures</u>. A wider definition often includes within its scope the design of the total built environment: from the macrolevel of <u>town planning, urban design, and landscape architecture</u> to the microlevel of creating <u>furniture</u>. The term "Architecture" is also used for the profession of providing <u>architectural services</u>.</p> <p>Architectural design involves the <u>manipulation</u> of <u>space, volume, texture, light, shadow</u>, and abstract elements in order to achieve an <u>aesthetic end</u>. This distinguishes it from the applied science of engineering which usually concentrates on the functional and feasibility aspects of a design. Architectural works are also seen as cultural and political <u>symbols</u> and works of art.</p> <p>Historical <u>civilizations</u> are often known primarily through their architectural achievements. Such buildings as the <u>pyramids</u> of <u>Egypt</u> and the <u>Roman Colosseum</u> are cultural symbols, and are an important link in public consciousness, even when <u>scholars</u> have discovered much about a past civilization through other means.</p>	<p>In <u>architecture, construction, engineering</u> and <u>real estate development</u> the word building may refer to one of the following:</p> <ol style="list-style-type: none"> 1. Any man-made structure used or intended for supporting or sheltering any use or continuous <u>occupancy</u>, or 2. An act of <u>construction</u>. <p>To differentiate buildings and other structures that are not intended for <u>continuous human occupancy</u>, the latter are called <u>nonbuilding structures</u>. Structural height in technical usage is the height to the highest architectural detail on building from street-level. Depending on how they are classified, spires and masts may or may not be included in this height. Spires and masts used as antennas are not generally included.</p>	<p>Civil engineering is a broad field of <u>engineering</u> dealing with the <u>planning, design, construction, maintenance and management</u> of physical <u>infrastructure</u> networks. This includes fixed <u>structures</u>, or <u>public works</u>, as they are related to <u>earth, water, or civilization</u> and their processes. Most civil engineering today deals with <u>power plants, bridges, roads, railways, structures, water supply, irrigation, the natural environment, sewer, flood control, transportation</u> and <u>traffic</u>.</p> <p>Engineering has developed from observations of the ways natural and constructed systems react and from the development of empirical equations that provide bases for design. Civil engineering is the broadest of the engineering fields, partly because it is the oldest of all engineering fields. In fact, engineering was once divided into only two fields - military and civil. Civil engineering was defined to distinguish it from <u>military engineering</u>. Within the <u>US</u>, some federal government funding and organization is still part of the <u>United States Army</u> as the <u>Corps of Engineers</u>. Civil engineering is still an umbrella term, comprised of many related specialties.</p> <p>A civil engineer is a person who practices <u>civil engineering</u>. Originally a <u>civil engineer</u> worked on public works projects</p>	<p>An engineer is someone who is trained or professionally engaged in a branch of <u>engineering</u>. Engineers use <u>creativity, technology, and scientific knowledge</u> to solve practical <u>problems</u>. People who work as engineers typically have an <u>academic degree</u> (or equivalent work experience) in one of the <u>engineering disciplines</u>.</p> <p>Engineering is the design, analysis, and/or construction of works for practical purposes. The <u>Engineers' Council for Professional Development</u>, also known as ECPD, defines Engineering as: "The creative application of scientific principles to design or develop structures, machines, apparatus, or manufacturing processes, or works utilizing them singly or in combination; or to construct or operate the same with full cognizance of their design; or to forecast their behavior under specific operating conditions; all as respects an intended function, economics of operation and safety to life and property." One who practices engineering is called an <u>engineer</u>, and those licensed to do so have formal designations such as <u>Professional Engineer</u>, <u>Chartered Engineer</u> or <u>Incorporated Engineer</u>. The broad discipline of engineering encompasses a range of specialized <u>subdisciplines</u> that focus on the issues associated with developing a specific kind of product, or using a specific</p>

	<p>to place (see below).</p> <p>The most prestigious award a living architect can receive is the <u>Pritzker Prize</u>, often termed the "<u>Nobel Prize</u> for <u>architecture</u>." <u>Other awards</u> for excellence in architecture are given by national regional professional associations such as the <u>American Institute of Architects</u> and <u>Royal Institute of British Architects</u>. Other prestigious architectural awards are the Alvar Aalto Medal (Finland) and the Carlsberg Architecture Prize (Denmark).</p> <p>Although the term "architect" refers to a professionally-qualified individual, the word is frequently used in the broader sense noted above to define someone who brings order to a built or non-built situation.</p>	<p>By extension, the term "architecture" has come to denote the <u>art</u> and <u>discipline</u> of creating an actual, or inferring an implied or apparent plan of any complex object or <u>system</u>. The term can be used to connote the <i>implied architecture</i> of abstract things such as <u>music</u> or <u>mathematics</u>, the <i>apparent architecture</i> of natural things, such as <u>geological</u> formations or the <u>structure</u> of biological cells, or explicitly <i>planned architectures</i> of human-made things such as <u>software</u>, <u>computers</u>, <u>enterprises</u>, and <u>databases</u>, in addition to buildings. In every usage, an architecture may be seen as a <i>subjective mapping</i> from a human perspective (that of the <i>user</i> in the case of abstract or physical artifacts) to the <u>elements</u> or <u>components</u> of some kind of <u>structure</u> or system, which preserves the relationships among the elements or components.</p> <p>This article is about architecture as it pertains to the <u>built environment</u>.</p>		<p>and was contrasted with the <u>military engineer</u>, who worked on armaments and defenses. Over time, various branches of engineering have become recognized as distinct from civil engineering, including <u>chemical engineering</u>, <u>mechanical engineering</u>, and <u>electrical engineering</u>, while much of military engineering has been absorbed by civil engineering.</p> <p>In most countries, a civil engineer has graduated from a post-secondary school with a degree in civil engineering, which requires a strong background in mathematics and the physical sciences; this degree is typically a four-year degree, though many civil engineers continue on to obtain additional degrees. In many countries, civil engineers are subject to <u>licensure</u>, and often, persons not licensed may not call themselves "civil engineers".</p> <p>In the United States, most civil engineers practice in particular specialties of civil engineering, such as <u>geotechnical engineering</u>, <u>structural engineering</u>, <u>transportation engineering</u>, <u>hydraulic engineering</u>, or <u>environmental engineering</u>. Civil engineers are typically employed by municipalities, construction firms, consulting engineering firms, state governments, and the federal government.</p>	<p>type of technology.</p>
